

Training

Not even the best computers, or most advanced programs will, alone, do your work for you. Even high levels of automatics require knowledge to put the computers and programs to the most effective use possible.

All our service programs are accompanied by trainings which enable our clients to integrate information and communication technology into their work, to the highest degree possible, as well as to use it for their business in the best possible way.

We include training on working with infrastructure and help our clients plan, design and/ or develop the same.

The **Internet** is, currently, the unchallenged source of knowledge and a tool with which much can be accomplished. Therefore, it is crucial to know how to maximize its usage. Business use of the Internet is the first training program we have developed as an additional business-training course in the area of information and communication technology.

With the use and development of computers come many dangers, both from the Internet and from our co-workers who do not know how to protect their computers.

In the **Computer Security** training program we familiarize our users with the dangers, the tools and techniques for protecting themselves from such perils, and teach them how they can use everything they need on the computer, without fear and unnecessary restraints.

IT Infrastructure

Our goal is to help our clients become more efficient in their work by helping them master information and communication technology.

The first step in doing so is to set up the infrastructure. For the infrastructure we can offer a comprehensive range of services, from a needs evaluation and a draft framework to a “turn-key” type solution.

We work with major distributors of IT equipment in the region and are, therefore, able to offer our clients hardware solutions of the highest quality in the selection and purchase of computers, as well as their interconnecting, in either wireless and hard-line technology and Internet connection.

About Us

The IT sector of our company offers consulting services, support and education. We believe that it is always better to invest in local knowledge, and not in foreign licenses.

In this we cover the entire spectrum: from assisting our clients in the selection and development of their infrastructure, both hardware and software, and helping them to best adjust it to their needs; to providing possibilities for constant Internet presence through the development of up-to-date and highly functional Internet presentations.

We promote the advantages of open-source software and offer our clients an easy and inexpensive migration from Windows to Linux platforms, with comprehensive solutions for their business, based on the open-source technology. Our choice for this migration is the Ubuntu distribution of Linux.

Our partners are major regional hardware and software distributors, as well as Internet providers; thus, we can offer a high quality base for the application of information and communication technology in our clients' business.

Web Design

One of the main ways to improve the efficiency, image and profit of a company is to establish a constant Internet presence, which means the existence of a company website. As a result, your present, but also your potential clients can, at any time, access information about your company and the products and services you offer.

We offer the development of websites best suited to your needs. We work with our clients, adjust to their needs and find solutions tailored to their wishes.

Our team will help you to achieve a noted Internet presence, and, by counsel, at all times, offer outstanding quality and service at the highest level.
